

Anode Edge Guards

- Enables long-term integrity of both the diaphragm and anode screen.
- Abrasion-resistant cathode installation between anode screens.
- Vertical slits machined into the legs of the Guard help the user lift up the Guard and to flex it, for ease of installation/removal.
- Longitudinal channels aid in flexibility of the Guard, to better mimic the radius of the top of the anode screen, while diminishing flaring of the Guards over time, that can otherwise make Guard installation/removal difficult.
 - Remainder of the Guard is thicker, aiding Guard durability.
- HDPE Guard is custom-machined per customer specs, such as being compatible with anode retaining clip location.
